FUSED HETEROARYLS AND THEIR USES

This application is the U.S. National Stage Application of International Application No. PCT/CN2011/079684, filed Sep. 15, 2011, which claims priority under 35 U.S.C. §365(b) to International Application No. PCT/CN2010/076996 designating at least one country other than the U.S., filed Sep. 16, 2010.

Phosphoinositide 3-kinases (PI 3-kinases or PI3Ks) are a family of enzymes that may be involved in cellular functions such as cell growth, proliferation, differentiation, motility, survival and intracellular trafficking, which in turn can be involved in cancer.

The PI3K family may include four distinct classes defined by structural and functional characteristics and termed as Classes I-IV. The most fully characterized class may be the Class I-PI3Ks. Class I comprises three class I α isoforms—PI3K α , PI3K β and PI3K δ . PI3K α appears to be highly relevant in human cancers and malignancies. PI3K α can be overexpressed in human cancers.

Mammalian target of rapamycin (mTOR) is the downstream kinase of PI3K family. Inhibition of mTOR can inhibit the activity of PI3K. Therefore, the PI3K/mTOR pathway can be exploited for new cancer drug discovery.

As used in the present specification, the following words, phrases and symbols are generally intended to have the meanings as set forth below, except to the extent that the context in which they are used indicates otherwise. The following abbreviations and terms have the indicated meanings throughout:

A dash (“-”) that is not between two letters or symbols is used to indicate a point of attachment for a substituent. For example, —CONH_2 is attached through the carbon atom.

The term “alkyl” herein refers to a straight or branched hydrocarbon, containing 1-18, such as 1-12, further such as 1-6 carbon atoms. Examples of alkyl groups include, but are not limited to, methyl, ethyl, n-propyl, i-propyl, n-butyl, i-butyl, and t-butyl. “Lower alkyl” refers to a straight or branched hydrocarbon, containing 1-6, such as 1-4 carbon atoms.

The term “alkoxy” herein refers to a straight or branched alkyl group of the indicated number of carbon atoms attached through an oxygen bridge such as, for example, methoxy, ethoxy, propoxy, isopropoxy, n-butoxy, sec-butoxy, tert-butoxy, pentoxy, 2-pentyloxy, isopentoxy, neopentoxy, hexoxy, 2-hexoxy, 3-hexoxy, 3-methylpentoxy, and the like. Alkoxy groups will usually have from 1 to 6 carbon atoms attached through the oxygen bridge. “Lower alkoxy” refers to a straight or branched alkoxy, wherein the alkyl portion contains 1-4 carbon atoms.

The term “alkenyl” herein refers to a straight or branched hydrocarbon, containing one or more $\text{C}=\text{C}$ double bonds and 2-10, such as 2-6 carbon atoms. Examples of alkenyl groups include, but are not limited to, vinyl, 2-propenyl, and 2-butenyl.

The term “alkynyl” herein refers to a straight or branched hydrocarbon, containing one or more $\text{C}\equiv\text{C}$ triple bonds and

2-10, such as 2-6 carbon atoms. Examples of alkynyl groups include, but are not limited to, ethynyl, 2-propynyl, and 2-butenyl.

The term “cycloalkyl” refers to saturated and partially unsaturated cyclic hydrocarbon groups having 3 to 12, such as 3 to 8 carbon atoms. Examples of cycloalkyl groups include, but are not limited to, cyclopropyl, cyclobutyl, cyclopentyl, cyclopentenyl, cyclohexyl, cyclohexenyl, cycloheptyl, and cyclooctyl. The ring may be saturated or have one or more double bonds (i.e. partially unsaturated), but not fully conjugated, and not aromatic, as defined herein.

“Aryl” encompasses:

5- and 6-membered carbocyclic aromatic rings, for example, phenyl;

bicyclic ring systems wherein at least one ring is carbocyclic and aromatic, for example, naphthalene, indane, and 1,2,3,4-tetrahydroquinoline; and

tricyclic ring systems wherein at least one ring is carbocyclic and aromatic, for example, fluorene.

For example, aryl includes 5- and 6-membered carbocyclic aromatic rings fused to a 5- to 7-membered cycloalkyl or heterocyclic ring containing zero or more heteroatoms selected from N, O, and S, provided that the point of attachment is at the carbocyclic aromatic ring when the carbocyclic aromatic ring is fused with a heterocyclic ring, and the point of attachment can be at the carbocyclic aromatic ring or at the cycloalkyl when the carbocyclic aromatic ring fused with a cycloalkyl. Bivalent radicals formed from substituted benzene derivatives and having the free valences at ring atoms are named as substituted phenylene radicals. Bivalent radicals derived from univalent polycyclic hydrocarbon radicals whose names end in “-yl” by removal of one hydrogen atom from the carbon atom with the free valence are named by adding “-idene” to the name of the corresponding univalent radical, e.g., a naphthyl group with two points of attachment is termed naphthylidene. Aryl, however, does not encompass or overlap in any way with heteroaryl, separately defined below. Hence, if one or more carbocyclic aromatic rings are fused with a heterocyclic aromatic ring, the resulting ring system is heteroaryl, not aryl, as defined herein.

The term “halo” includes fluoro, chloro, bromo, and iodo, and the term “halogen” includes fluorine, chlorine, bromine, and iodine.

The term “heteroaryl” refers to

5- to 7-membered aromatic, monocyclic rings containing one or more, for example, from 1 to 4, or, in some embodiments, from 1 to 3, heteroatoms selected from N, O, and S, with the remaining ring atoms being carbon;

8- to 12-membered bicyclic rings containing one or more, for example, from 1 to 4, or, in some embodiments, from 1 to 3, heteroatoms selected from N, O, and S, with the remaining ring atoms being carbon and wherein at least one ring is aromatic and at least one heteroatom is present in the aromatic ring; and

11- to 14-membered tricyclic rings containing one or more, for example, from 1 to 4, or in some embodiments, from 1 to 3, heteroatoms selected from N, O, and S, with the remaining ring atoms being carbon and wherein at least one ring is aromatic and at least one heteroatom is present in an aromatic ring.

For example, heteroaryl includes a 5- to 7-membered heterocyclic aromatic ring fused to a 5- to 7-membered cycloalkyl ring. For such fused, bicyclic heteroaryl ring systems wherein only one of the rings contains one or more heteroatoms, the point of attachment may be at the heteroaromatic ring or at the cycloalkyl ring.

When the total number of S and O atoms in the heteroaryl group exceeds 1, those heteroatoms are not adjacent to one another. In some embodiments, the total number of S and O atoms in the heteroaryl group is not more than 2. In some embodiments, the total number of S and O atoms in the aromatic heterocycle is not more than 1.

Examples of heteroaryl groups include, but are not limited to, (as numbered from the linkage position assigned priority 1), pyridyl (such as 2-pyridyl, 3-pyridyl, or 4-pyridyl), pyrazinyl, 2,4-pyrimidinyl, 3,5-pyrimidinyl, 2,4-imidazolyl, isoxazolyl, oxazolyl, thiazolyl, thiadiazolyl, tetrazolyl, thienyl, benzothienyl, furyl, benzofuryl, benzoimidazolyl, indolyl, indolinyl, pyridizynyl, triazolyl, quinolynyl, pyrazolyl, pyrrolopyridinyl (such as 1H-pyrrolo[2,3-b]pyridin-5-yl), pyrazolopyridinyl (such as 1H-pyrazolo[3,4-b]pyridin-5-yl), benzoxazolyl (such as benzo[d]oxazol-6-yl), benzothiazolyl (such as benzo[d]thiazol-6-yl), indazolyl (such as 1H-indazol-5-yl) and 5,6,7,8-tetrahydroisoquinoline.

Bivalent radicals derived from univalent heteroaryl radicals whose names end in “-yl” by removal of one hydrogen atom from the atom with the free valence are named by adding “-idene” to the name of the corresponding univalent radical, e.g., a pyridyl group with two points of attachment is a pyridylidene. Heteroaryl does not encompass or overlap with aryl as defined above.

Substituted heteroaryl also includes ring systems substituted with one or more oxide (—O—) substituents, such as pyridinyl N-oxides.

By “heterocycle” or “heterocyclic ring” is meant a 4- to 12-membered monocyclic, bicyclic or tricyclic saturated or partially unsaturated ring containing at least 2 carbon atoms in addition to 1-3 heteroatoms independently selected from oxygen, sulfur, and nitrogen. “Heterocycle” also refers to 5- to 7-membered heterocyclic ring containing one or more heteroatoms selected from N, O, and S fused with 5-, 6-, and/or 7-membered cycloalkyl, carbocyclic aromatic or heteroaromatic ring, provided that the point of attachment is at the heterocyclic ring when the heterocycle ring is fused with a carbocyclic aromatic or a heteroaromatic ring, and that the point of attachment can be at the cycloalkyl or heterocyclic ring when the heterocyclic ring is fused with cycloalkyl. “Heterocycle” also refers to an aliphatic spirocyclic ring containing one or more heteroatoms selected from N, O, and S, provided that the point of attachment is at the heterocyclic ring. The rings may be saturated or have one or more double bonds (i.e. partially unsaturated). The heterocycle can be substituted by oxo. The point of the attachment may be carbon or heteroatom in the heterocyclic ring. A heterocycle is not a heteroaryl as defined herein.

Suitable heterocycles include, for example (as numbered from the linkage position assigned priority 1), 1-pyrrolidinyl, 2-pyrrolidinyl, 2,4-imidazolidinyl, 2,3-pyrazolidinyl, 1-piperidinyl, 2-piperidinyl, 3-piperidinyl, 4-piperidinyl, 2,5-piperazinyl, pyranyl, 2-morpholinyl and 3-morpholinyl. Substituted heterocycle also includes ring systems substituted with one or more oxo moieties, such as piperidinyl N-oxide, morpholinyl-N-oxide, 1-oxo-1-thiomorpholinyl and 1,1-dioxo-1-thiomorpholinyl.

By “optional” or “optionally” is meant that the subsequently described event or circumstance may or may not occur, and that the description includes instances where the event or circumstance occurs and instances in which it does not. For example, “optionally substituted alkyl” encompasses both “alkyl” and “substituted alkyl” as defined below. It will be understood by those skilled in the art, with respect to any group containing one or more substituents, that such groups

are not intended to introduce any substitution or substitution patterns that are sterically impractical, synthetically non-feasible and/or inherently unstable.

The term “substituted”, as used herein, means that any one or more hydrogen atoms on the designated atom or group is replaced with a selection from the indicated group, provided that the designated atom’s normal valence is not exceeded. When a substituent is oxo (i.e., =O) then 2 hydrogen atoms on the atom are replaced. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds or useful synthetic intermediates. A stable compound or stable structure is meant to imply a compound that is sufficiently robust to survive isolation from a reaction mixture, and subsequent formulation as an agent having at least practical utility. Unless otherwise specified, substituents are named into the core structure. For example, it is to be understood that when (cycloalkyl)alkyl is listed as a possible substituent, the point of attachment of this substituent to the core structure is in the alkyl portion.

In some embodiments, “substituted with one or more groups” refers to two hydrogen atoms on the designated atom or group being independently replaced with two selections from the indicated group of substituents. In some embodiments, “substituted with one or more groups” refers to three hydrogen atoms on the designated atom or group being independently replaced with three selections from the indicated group of substituents. In some embodiments, “substituted with one or more groups” refers to four hydrogen atoms on the designated atom or group being independently replaced with four selections from the indicated group of substituents.

Compounds described herein include, but are not limited to, when possible, their optical isomers, such as enantiomers and diastereomers, mixtures of enantiomers, including racemates, mixtures of diastereomers, and other mixtures thereof, to the extent they can be made by one of ordinary skill in the art by routine experimentation. In those situations, the single enantiomers or diastereomers, i.e., optically active forms, can be obtained by asymmetric synthesis or by resolution of the racemates or mixtures of diastereomers. Resolution of the racemates or mixtures of diastereomers, if possible, can be accomplished, for example, by conventional methods such as crystallization in the presence of a resolving agent, or chromatography, using, for example a chiral high-pressure liquid chromatography (HPLC) column. In addition, such compounds include Z- and E-forms (or cis- and trans-forms) of compounds with carbon-carbon double bonds. Where compounds described herein exist in various tautomeric forms, the term “compound” is intended to include, to the extent they can be made without undue experimentation, all tautomeric forms of the compound. Such compounds also include crystal forms including polymorphs and clathrates, to the extent they can be made by one of ordinary skill in the art by routine experimentation. Similarly, the term “salt” is intended to include all isomers, racemates, other mixtures, Z- and E-forms, tautomeric forms and crystal forms of the salt of the compound, to the extent they can be made by one of ordinary skill in the art without undue experimentation.

“Pharmaceutically acceptable salts” include, but are not limited to salts with inorganic acids, such as hydrochlorate, phosphate, diphosphate, hydrobromate, sulfate, sulfinate, nitrate, and like salts; as well as salts with an organic acid, such as malate, maleate, fumarate, tartrate, succinate, citrate, lactate, methanesulfonate, p-toluenesulfonate, 2-hydroxyethylsulfonate, benzoate, salicylate, stearate, alkanoate such as acetate, and salts with HOOC—(CH₂)_n—COOH where n is 0-4, and like salts. Similarly, pharmaceutically acceptable

cations include, but are not limited to sodium, potassium, calcium, aluminum, lithium, and ammonium.

In addition, if a compound described herein is obtained as an acid addition salt, the free base can be obtained by basifying a solution of the acid salt. Conversely, if the product is a free base, an addition salt, particularly a pharmaceutically acceptable addition salt, may be produced by dissolving the free base in a suitable organic solvent and treating the solution with an acid, in accordance with conventional procedures for preparing acid addition salts from base compounds. Those skilled in the art will recognize various synthetic methodologies that may be used without undue experimentation to prepare non-toxic pharmaceutically acceptable addition salts.

A "solvate," such as a "hydrate," is formed by the interaction of a solvent and a compound. The term "compound" is intended to include solvates, including hydrates, of compounds, to the extent they can be made by one of ordinary skill in the art by routine experimentation. Similarly, "salts" includes solvates, such as hydrates, of salts, to the extent they can be made by one of ordinary skill in the art by routine experimentation. Suitable solvates are pharmaceutically acceptable solvates, such as hydrates, including monohydrates and hemi-hydrates, to the extent they can be made by one of ordinary skill in the art by routine experimentation.

A "chelate" is formed by the coordination of a compound to a metal ion at two (or more) points. The term "compound" is intended to include chelates of compounds. Similarly, "salts" includes chelates of salts.

A "non-covalent complex" is formed by the interaction of a compound and another molecule wherein a covalent bond is not formed between the compound and the molecule. For example, complexation can occur through van der Waals interactions, hydrogen bonding, and electrostatic interactions (also called ionic bonding). Such non-covalent complexes are included in the term "compound."

The term "hydrogen bond" refers to a form of association between an electronegative atom (also known as a hydrogen bond acceptor) and a hydrogen atom attached to a second, relatively electronegative atom (also known as a hydrogen bond donor). Suitable hydrogen bond donor and acceptors are well understood in medicinal chemistry (G. C. Pimentel and A. L. McClellan, *The Hydrogen Bond*, Freeman, San Francisco, 1960; R. Taylor and O. Kennard, "Hydrogen Bond Geometry in Organic Crystals", *Accounts of Chemical Research*, 17, pp. 320-326 (1984)).

As used herein the terms "group," "radical" or "fragment" are synonymous and are intended to indicate functional groups or fragments of molecules attachable to a bond or other fragments of molecules.

The term "active agent" is used to indicate a chemical substance which has biological activity. In some embodiments, an "active agent" is a chemical substance having pharmaceutical utility.

"Treating," "treat," or "treatment" or "alleviation" refers to administering at least one compound and/or at least one pharmaceutically acceptable salt thereof described herein to a subject that has cancer, or has a symptom of cancer, or has a predisposition toward cancer, with the purpose to cure, heal, alleviate, relieve, alter, remedy, ameliorate, improve, or affect cancer, the symptoms of cancer, or the predisposition toward cancer.

The term "effective amount" refers to an amount of at least one compound and/or at least one pharmaceutically acceptable salt thereof described herein effective to "treat," as defined above, a disease or disorder in a subject. In the case of cancer, the effective amount may cause any of the changes observable or measurable in a subject as described in the

definition of "treating," "treat," "treatment" and "alleviation" above. For example, the effective amount can reduce the number of cancer or tumor cells; reduce the tumor size; inhibit or stop tumor cell infiltration into peripheral organs including, for example, the spread of tumor into soft tissue and bone; inhibit and stop tumor metastasis; inhibit and stop tumor growth; relieve to some extent one or more of the symptoms associated with the cancer, reduce morbidity and mortality; improve quality of life; or a combination of such effects. An effective amount may be an amount sufficient to decrease the symptoms of a disease responsive to inhibition of PI3K/mTOR activity. For cancer therapy, efficacy in vivo can, for example, be measured by assessing the duration of survival, time to disease progression (TTP), the response rates (RR), duration of response, and/or quality of life. Effective amounts may vary, as recognized by those skilled in the art, depending on route of administration, excipient usage, and co-usage with other agents.

The term "inhibition" indicates a decrease in the baseline activity of a biological activity or process. "Inhibition of PI3K and/or mTOR activity" refers to a decrease in the activity of PI3K and/or mTOR as a direct or indirect response to the presence of at least one compound and/or at least one pharmaceutically acceptable salt described herein, relative to the activity of PI3K and/or mTOR in the absence of the at least one compound and/or the at least one pharmaceutically acceptable salt thereof. The decrease in activity is not bound by theory and may be due to the direct interaction of the at least one compound and/or at least one pharmaceutically acceptable salt thereof described herein with PI3K and/or mTOR, or due to the interaction of the at least one compound and/or at least one pharmaceutically acceptable salt described herein, with one or more other factors that in turn affect PI3K and/or mTOR activity. For example, the presence of at least one compound and/or at least one pharmaceutically acceptable salt thereof described herein, may decrease PI3K and/or mTOR activity by directly binding to the PI3K and/or mTOR, by causing (directly or indirectly) another factor to decrease PI3K and/or mTOR activity, or by (directly or indirectly) decreasing the amount of PI3K and/or mTOR present in the cell or organism.

The compounds thus obtained can be further modified at their peripheral positions to provide the desired compounds. Synthetic chemistry transformations are described, for example, in R. Larock, *Comprehensive Organic Transformations*, VCH Publishers (1989); T. W. Greene and P. G. M. Wuts, *Protective Groups in Organic Synthesis*, 3rd Ed., John Wiley and Sons (1999); L. Fieser and M. Fieser, *Fieser and Fieser's Reagents for Organic Synthesis*, John Wiley and Sons (1994); and L. Paquette, ed., *Encyclopedia of Reagents for Organic Synthesis*, John Wiley and Sons (1995) and subsequent editions thereof.

Before use, the at least one compound and/or at least one pharmaceutically acceptable salt described herein, can be purified by column chromatography, high performance liquid chromatography, crystallization, or other suitable methods.

Also provided is a composition comprising at least one compound and/or at least one pharmaceutically acceptable salt described herein, and at least one pharmaceutically acceptable carrier.

A composition comprising at least one compound and/or at least one pharmaceutically acceptable salt described herein, can be administered in various known manners, such as orally, parenterally, by inhalation spray, or via an implanted reservoir. The term "parenteral" as used herein includes subcutaneous, intracutaneous, intravenous, intramuscular, intraarticular, intraarterial, intrasynovial, intrasternal, intrathecal, intralesional and intracranial injection or infusion techniques.

An oral composition can be any orally acceptable dosage form including, but not limited to, tablets, capsules, emulsions, and aqueous suspensions, dispersions and solutions. Commonly used carriers for tablets include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added to tablets. For oral administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions or emulsions are administered orally, the active ingredient can be suspended or dissolved in an oily phase combined with emulsifying or suspending agents. If desired, certain sweetening, flavoring, or coloring agents can be added.

A sterile injectable composition (e.g., aqueous or oleaginous suspension) can be formulated according to techniques known in the art using suitable dispersing or wetting agents (such as, for example, Tween 80) and suspending agents. The sterile injectable preparation can also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butenediol. Among the pharmaceutically acceptable vehicles and solvents that can be employed are mannitol, water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium (e.g., synthetic mono- or di-glycerides). Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions can also contain a long-chain alcohol diluent or dispersant, or carboxymethyl cellulose or similar dispersing agents.

An inhalation composition can be prepared according to techniques well known in the art of pharmaceutical formulation and can be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other solubilizing or dispersing agents known in the art.

A topical composition can be formulated in form of oil, cream, lotion, ointment and the like. Suitable carriers for the composition include vegetable or mineral oils, white petrolatum (white soft paraffin), branched chain fats or oils, animal fats and high molecular weight alcohols (greater than C12). In some embodiments, the pharmaceutically acceptable carrier is one in which the active ingredient is soluble. Emulsifiers, stabilizers, humectants and antioxidants may also be included as well as agents imparting color or fragrance, if desired. Additionally, transdermal penetration enhancers may be employed in those topical formulations. Examples of such enhancers can be found in U.S. Pat. Nos. 3,989,816 and 4,444,762.

Creams may be formulated from a mixture of mineral oil, self-emulsifying beeswax and water in which mixture the active ingredient, dissolved in a small amount of an oil, such as almond oil, is admixed. An example of such a cream is one which includes about 40 parts water, about 20 parts beeswax, about 40 parts mineral oil and about 1 part almond oil. Ointments may be formulated by mixing a solution of the active ingredient in a vegetable oil, such as almond oil, with warm soft paraffin and allowing the mixture to cool. An example of such an ointment is one which includes about 30% by weight almond oil and about 70% by weight white soft paraffin.

A pharmaceutically acceptable carrier refers to a carrier that is compatible with active ingredients of the composition (and in some embodiments, capable of stabilizing the active ingredients) and not deleterious to the subject to be treated. For example, solubilizing agents, such as cyclodextrins (which form specific, more soluble complexes with the at

least one compound and/or at least one pharmaceutically acceptable salt described herein), can be utilized as pharmaceutical excipients for delivery of the active ingredients. Examples of other carriers include colloidal silicon dioxide, magnesium stearate, cellulose, sodium lauryl sulfate, and pigments such as D&C Yellow #10.

Suitable in vitro assays can be used to preliminarily evaluate the efficacy of the at least one compound and/or at least one pharmaceutically acceptable salt described herein, in inhibiting the activity of PI3K and/or mTOR. The at least one compound and/or at least one pharmaceutically acceptable salt described herein, can further be examined for efficacy in treating cancer by in vivo assays. For example, the compounds described herein, and/or the pharmaceutically acceptable salts thereof, can be administered to an animal (e.g., a mouse model) having cancer and its therapeutic effects can be accessed. Positive results in one or more of such tests are sufficient to increase the scientific storehouse of knowledge and hence sufficient to demonstrate practical utility of the compounds and/or salts tested. Based on the results, an appropriate dosage range and administration route for animals, such as humans, can also be determined.

Also provided is a method of inhibiting the activity of PI3K and/or mTOR. The method comprises contacting the enzyme with at least one compound and/or at least one pharmaceutically acceptable salt described herein in an amount effective to inhibit the activity of PI3K and/or mTOR.

(R)-1-(4-(8-(6-amino-5-(trifluoromethyl)pyridin-3-yl)-1H-[1,2,3]triazolo[4,5-c][1,5]naphthyridin-1-yl)piperidin-1-yl)-2-hydroxypropan-1-one

39

To a solution of 8-chloro-1-(piperidin-4-yl)-1H-[1,2,3]triazolo[4,5-c][1,5]naphthyridine hydrochloride (600 mg, 1.85 mmol) in DMF (15 mL) was added (R)-2-hydroxypropanoic acid (540 mg, 1.85 mmol), HATU (850 mg, 2.21 mmol) and DIEA (0.8 mL, 3.70 mmol). The mixture was stirred at room temperature overnight. Another 3 eq of HATU and 2 eq of DIEA were added because the reaction did not go to completion as shown by HPLC-MS. The mixture was stirred for another 30 min, and was then diluted with water. The resulting mixture was extracted with ethyl acetate twice. The combined organic layers were dried over anhydrous Na₂SO₄, and concentrated to give the crude product, which was subsequently purified by chromatography on silica gel using EtOAc:PE as eluent to afford (R)-1-(4-(8-chloro-1H-[1,2,3]triazolo[4,5-c][1,5]naphthyridin-1-yl)piperidin-1-yl)-

(4-(8-(6-amino-5-(trifluoromethyl)pyridine-3-yl)-2-methyl-1H-imidazo[4,5-c][1,5]naphthyridin-1-yl)piperidin-1-yl)(cyclopropyl)methanone

-continued

A mixture of tert-butyl 4-(3-amino-6-chloro-1,5-naphthyridin-4-ylamino) piperidine-1-carboxylate (200 mg, 0.53 mmol) in acetic acid (3 mL) was stirred at 100° C. overnight. The solvent was removed under vacuum and the residue was added to a solution of HCl in MeOH (6N, 3 mL). The reaction mixture was stirred at r.t. for 2 h, and was then concentrated under vacuum. The residue was dissolved in dichloromethane (20 mL). The resulting solution was washed with saturated NaHCO₃ (10 mL) and brine (10 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated to give crude 8-chloro-2-methyl-1-(piperidin-4-yl)-1H-imidazo[4,5-c][1,5]naphthyridine as a yellow solid (110 mg, yield 68%) which was used in the next step without further purification.

To a solution of 8-chloro-2-methyl-1-(piperidin-4-yl)-1H-imidazo[4,5-c][1,5]naphthyridine (110 mg, 0.364 mmol) and Et₃N (101 µL, 0.728 mmol) in THF (15 mL) was added cyclopropanecarbonyl chloride (36 µL, 0.401 mmol) while cooling with an ice-water bath. The reaction mixture was stirred at r.t. for 3 h, and was then concentrated under vacuum. The residue was dissolved in a mixture of CH₂Cl₂ (10 mL) and H₂O (10 mL). The resulting solution was then extracted with EA (2×10 mL). The combined organic layers were concentrated to give crude (4-(8-chloro-2-methyl-1H-imidazo[4,5-c][1,5]naphthyridin-1-yl) piperidin-1-yl)(cyclopropyl) methanone as a yellow solid (105 mg, yield 80%) which was used in the next step without further purification. MS (m/z): 370 (M+H)⁺.

A mixture of crude (4-(8-chloro-2-methyl-1H-imidazo[4,5-c][1,5]naphthyridin-1-yl) piperidin-1-yl)(cyclopropyl) methanone (105 mg, 0.284 mmol), PdCl₂(dppf)₂ (12 mg, 0.014 mmol), 5-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-3-(trifluoromethyl) pyridine-2-amine (98 mg, 0.340 mmol), and 2 N K₂CO₃ solution (1 mL) in dioxane (4 mL) was microwaved at 150° C. for 30 min. The solvent was removed and the residue was purified by ISCO (MeOH/H₂O 0%~100%) to obtain compound 119 as a yellowish solid (57 mg). ¹H NMR (400 MHz, dmsO) δ 9.11 (d, J=6.8, 2H), 8.58 (s, 1H), 8.48 (d, J=8.8, 1H), 8.29 (d, J=8.3, 1H), 6.97 (s, 2H), 4.67-4.58 (m, 2H), 4.06 (s, 1H), 2.75 (m, 5H), 2.11-2.04 (m, 4H), 0.81 (s, 1H), 0.71 (m, 4H). MS (m/z): 496 (M+H)⁺.

A mixture of 7-bromo-2-hydrazinylquinoxaline (200 mg, 0.84 mmol) and AcOH (5 mL) was refluxed overnight. After cooling to r.t., the mixture was treated with water (10 mL); the solid was collected on a filter and dried by vacuum to give 8-bromo-1-methyl-[1,2,4]triazolo[4,3-a]quinoxaline as gray solid (200 mg, yield: 91.0%).

A mixture of 8-bromo-1-methyl-[1,2,4]triazolo[4,3-a]quinoxaline (60 mg, 0.23 mmol), 2,4-difluoro-N-(2-methoxy-5-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)pyridine-3-yl)benzenesulfonamide (107 mg, 0.25 mmol), K_2CO_3 (95 mg, 0.69 mmol) and $Pd(dppf)Cl_2$ (6 mg) in dioxane/ H_2O (3:1, 4 mL) was microwaved at 160° C. for 0.5 h. Then the solvent was removed, and the residue was purified by ISCO (MeOH/ H_2O =20%-80%) to give compound 147 as white solid (60 mg). 1H NMR (400 MHz, dmsO) δ 10.44 (s, 1H), 9.26 (s, 1H), 8.47 (d, J =1.7 Hz, 1H), 8.34 (d, J =1.5 Hz, 1H), 8.13 (t, J =10.3 Hz, 1H), 8.02 (d, J =2.1 Hz, 1H), 7.92 (dd, J =8.4, 1.5 Hz, 1H), 7.76 (dd, J =14.9, 8.5 Hz, 1H), 7.51 (dd, J =14.2, 5.4 Hz, 1H), 7.18 (t, J =7.5 Hz, 1H), 3.68 (s, 3H), 3.17 (s, 3H). To a white suspension of 1-(2-aminophenyl)ethanone (25 g, 185 mmol) and Et_3N (33.4 mL, 240 mmol) in DCM at 0°C . was added dropwise AcCl (15.70 mL, 222 mmol) in 25 mL DCM. The reaction mixture was then stirred at r.t. for 2 h. After the reaction went to completion as monitored by LC-MS, the reaction mixture was cooled to 0°C ., and was then quenched with H_2O (100 mL). The organic phase was isolated; the aqueous layer was extracted with DCM. The organic phases were combined, and washed with H_2O and brine. The resulting organic phase was dried over anhydrous MgSO_4 , filtered and concentrated to dryness to give crude N-(2-acetylphenyl)acetamide, which was used in the next step without further purification (30 g, yield 92%). MS (m/z): 136 ($\text{M}+\text{H}$) $^+$.

Under N_2 , a pale yellow suspension of crude N-(2-acetylphenyl)acetamide (28 g, 158 mmol) in AcOH (300 mL) was stirred for about 5 min, and Br_2 (12.95 mL, 253 mmol) was added within 1 h at room temperature. The resulting mixture was then stirred at room temperature for 75 min. After the reaction went to completion as monitored by LC-MS, the reaction mixture was quenched with H_2O (200 mL).

126

The mixture was filtered through Buchner funnel, and the solid was collected as N-(2-acetyl-4-bromophenyl)acetamide (35 g, yield 86%). MS (m/z): 216 ($\text{M}+\text{H}$) $^+$.

Under N_2 , a mixture of N-(2-acetyl-4-bromophenyl)acetamide (35 g, 137 mmol) and HCl (100 mL, 600 mmol) in THF (400 mL) was heated to reflux for 1 h. After being concentrated under vacuum to remove the solvent, the mixture was treated with EtOAc (100 mL). The aqueous layer was concentrated to remove THF, and 6N HCl (100 mL, 600 mmol) was added at room temperature. After cooling to 0°C ., the resulting mixture was treated dropwise with NaNO_2 (9.43 g, 137 mmol) in 20 mL H_2O . The reaction mixture was then stirred at r.t. for 15 h. Then the resulting mixture was heated to reflux for another 6 h. The mixture was cooled to r.t. The solid was collected and dried in vacuo, to afford the desired product as a white solid. The crude product was used directly in next step without further purification. (19.5 g, yield 63.4%) MS (m/z): 227 ($\text{M}+\text{H}$) $^+$.

Under N_2 , an orange solution of 6-bromocinnolin-4-ol (18.5 g, 82 mmol) in HNO_3 (90 mL, 82 mmol) was cooled to 0°C ., and H_2SO_4 (30 mL) was added. The resulting mixture was then heated at 60°C . for 3 h. After the reaction went to completion as monitored by LC-MS, the reaction mixture was cooled to 0°C ., and was then quenched with H_2O (20 mL). The mixture was diluted with EtOAc (25 mL). Following general workup procedures, the crude residue was added to silica gel, and eluted with PE/EtOAc to give 6-bromo-3-nitrocinnolin-4-ol as a pale yellow solid (13 g, yield 58.6%).

The reaction mixture was stirred at r.t. for 5 h. After the reaction went to completion as monitored by LC-MS, the reaction mixture was cooled to 0°C ., and then quenched with H_2O (50 mL). The mixture was filtered through a Buchner funnel, and the solid was collected. The crude 6-bromo-4-chloro-3-nitrocinnoline was used in the next step without further purification (1.75 g, yield 82%). MS (m/z): 290 ($\text{M}+\text{H}$) $^+$.

The workup followed general workup procedures, and the crude was purified on silica gel with PE/EtOAc as eluant to give 2-(4-(6-bromo-3-nitrocinnolin-4-ylamino)phenyl)-2-methylpropanenitrile as yellow solid (2.5 g, yield 100%). MS (m/z): 414 ($\text{M}+\text{H}$) $^+$.

After cooling to r.t., the pH of the mixture was adjusted to 8 with saturated Na_2CO_3 . The mixture was filtered through a Buchner funnel, and the filtrate was collected and concentrated to give 2-(4-(3-amino-6-bromocinnolin-4-ylamino)phenyl)-2-methylpropanenitrile (1.6 g, yield 69%). MS (m/z): 384 ($\text{M}+\text{H}$) $^+$.

EXAMPLE 13

PI3Ka Transcreeper ADP Assay

Fluorescence polarization was used in this assay. The final conditions for kinase assay are 10 μM of ATP, 0.2 ng/μL of PI3Kα kinase, 30 μmol/L of lipid substrate and assay buffer (50 mmol/L of HEPES (pH 7.5), 100 mmol/L of NaCl, 1 mmol/L of EGTA, 3 mmol/L of MgCl₂, 1 mmol/L of DTT and 0.03% CHAPS and 2% DMSO).

5 μL of test compounds in 10% DMSO and 10 μL of 0.5 ng/μL PI3K kinase (Invitrogen, PV4788) in assay buffer are put into a 96-well plate (Greiner, Cat. 675076), and then the reaction is started by the addition of 10 μL of 75 μmol/L PIP₂, (PS Lipid Substrate Invitrogen, PV5100), and 25 μmol/L ATP mixture. After the mixture is incubated for 60 minutes at room temperature, 25 μL of transcreeper Kinase Kit reagent—ADP Detection Mix—(Bellbrook Labs) is added, and the reaction is continued for an additional 1.5 hours. At the end, the plate is read in a Tecan Infinite F500 at excitation of 610 nm and emission of 670 nm.

A standard curve for ADP is obtained in a parallel way by replacing compound and PI3Kα kinase with DMSO and assay buffer, respectively. Different concentration of ADP, 0-10 μM, and ATP, 10-0 μM (ATP+ADP equal to 10 μM) are applied instead of a fixed concentration of ATP in this standard curve assay. Other conditions are the same as described above. The standard curve is plotted using Origin 8.0 software. The inhibition of test compound on ADP production is calculated based on ADP concentration from standard curve. IC₅₀ is obtained using XLfit 2.0 software.

For p-Akt Acumen assay, PC3 cells are seeded at a density of 5000 cells/90 μL in Poly-D-Lysine 96-well plate (BD, 356692). After incubation for 24 hours, different concentrations of test compounds (10 μL) is added and cells are incubated for another 2 hours. 100 μL of 4% prewarmed paraformaldehyde is added, and cells are fixed for 45 min at room temperature. After the removal of paraformaldehyde, 100 μL of 0.1% Triton X-100 is added, and cells are incubated for extra 30 min at room temperature. After the cells are washed twice with 160 μL of PBS, 100 μL of blocking buffer (1% BSA, in PBS) is added, and the cells are continued to incubate for 2~3 hours. Cells are washed with 160 μL of PBS again, treated with 30 μL of Ser473-p-Akt (Cell signaling, CAT: 4060) which is diluted in 0.1% BSA at 1:250, and incubated at 4° C. overnight. Cells are then washed twice with 160 μL of PBS. 35 μL of Alexa Fluor 488 goat anti-rabbit IgG (Invitrogen, A11034), in a 1:1000 dilution buffer (0.1% BSA in PBS), is added, and the reaction mixture is incubated for 1.5 hours in the dark. It is washed twice with 160 μL of PBS, and then 35 μL of 1.5 μM propidium iodide (Sigma, P4170) is added to each well, and reaction plate is incubated at 37° C., 5% CO₂ for 30 min. Finally, the plate is loaded into the Acumen eX3 (TTP LabTech) and scanned with the appropriate instrument settings.

The inhibition of test compound is calculated based on the ratio of compound treated and untreated cells. IC₅₀ is gener-
